ABSTRACT

Employment scheduling is the task of assigning ships to fulfill U. S. Navy commitments at home and abroad. Commitments are events, with fixed start and completion dates, that require specified ship resources. The objective of the employment schedule is to satisfy all event requirements while providing an equitable rotation of ships and an even distribution of workload.

This study provides a mathematical programming model to assist employment scheduling. A set covering formulation of the scheduling problem minimizes deviations from an "ideal" schedule, developed in terms of navy scheduling policy, while satisfying event requirements. An efficient column generation program, using problem-specific column reduction techniques, produces a moderate-sized problem which is then solved as an integer program.

The model is tested using data from the 1983 Atlantic Fleet schedule for carriers and surface combatants. The data involving 111 ships, 19 major events, 73 separate ship-type requirements, and 44 force weapon system capability requirements yields a set covering problem with 10,723 variables and 228 constraints. This problem is solved on an IBM 3033 AP in 84 seconds of CPU time.

ACKNOWLEDGEMENT

I would like to thank the scheduling staff at CINCLANTFLT for providing data and insight into the Navy employment scheduling problem. I am grateful to Professor Gerald G. Brown whose assistance with the X system was crucial to the development of this model. I am deeply indebted to Captain Dan Bausch, USMC, whose previous research at the Naval Postgraduate School contributed substantially to this study. I thank my wife, Linda, and two sons, Eric and Bobby, for their patience, understanding, and assistance during many long days and nights devoted to this study. Lastly, I express my most sincere appreciation to Professor Kevin Wood without whose support and professional assistance this project could not have been undertaken.

I. INTRODUCTION

> In its broadest sense, fleet readiness is the degree to which the force is ready to carry out its mission to wage prompt and sustained combat at sea. Supporting military strategy involves not only having units properly manned, trained, equipped, and supported, but also deployed to positions from which they may be able to best support U.S. interests and rapidly engage potential enemies....A properly balanced employment schedule is essential to attain high states of readiness, because the individual requirements for maintenance, training, and morale are frequently in competition with each other. [Ref. 1]

Employment scheduling is the process whereby U. S. Navy ships, submarines, aircraft and other units are assigned to major operations, exercises, maintenance periods, inspections and other events. The effectiveness of the employment scheduling process directly influences overall fleet combat readiness. Currently, this process is largely manual requiring several full time scheduling officers and additional personnel at various levels of management. This study develops and implements an optimization model that automates a substantial part of the employment scheduling problem. The model is formulated as a generalized set covering problem and may be applied to a number of independent subsets of the employment scheduling problem. For explanatory purposes, the model is applied to the annual planning schedule for naval combatants of the Atlantic Fleet.

A. CURRENT PROCEDURES

The Atlantic Fleet Employment Schedule details the day-to-day operations of the 700 to 750 units that comprise the Atlantic Fleet. The schedule is one of the primary methods for managing these fleet assets. Requests for fleet units to

participate in events, referred to as *event requests* in this study, originate from several sources, e.g., Secretary of Defense, Chief of Naval Operations, Type Commanders, Fleet Commanders, Group Commanders, Squadron Commanders, and individual unit commanders. Fleet assets are always in short supply relative to the demands resulting from all event requests. Fleet schedulers are faced with the problem of selecting which event requests will be scheduled and how to most efficiently schedule those events. The size and complexity of this scheduling problem demands the resources of numerous management personnel, e.g., operation and planning staffs, at all levels in the command structure.

Current Navy employment schedules are produced with little computer assistance. The Commander in Chief Atlantic Fleet (CINCLANTFLT) convenes a scheduling conference each quarter. This conference is the culmination of the employment scheduling process and results in publication of a detailed quarterly employment schedule with annual schedule projections. CINCLANTFLT's conference is preceded by Type Commander scheduling conferences. The Type Commander conferences are the working conferences where schedules are developed. At these conferences, rough schedules are proposed, reviewed, discussed, conflicts resolved, and bargains made until a final schedule is selected for submission to CINCLANTFLT. In the overall process, computers are only used to store and retrieve schedule data; they are not used to assist decision-making.

CINCLANTFLT is the overall schedule coordinator. Fleet assets are managed by the Type Commanders who, in turn, delegate part of their management responsibilities to group, squadron and unit commanders. CINCLANTFLT and the operational fleet commander (OPFLT) are primarily

concerned with meeting major operational commitments while Type Commanders and lower levels of command are principally concerned with maintenance, inspections, and training.

B. PROBLEM SCOPE

The entire employment scheduling problem is formidable. However, because of its structure, the problem can be divided into independent subproblems of manageable size. This study develops a model for the *Combatant Primary Event Schedule* (CPSKED) problem. The derivation of this problem from the overall employment scheduling problem is discussed in this section; the resulting CPSKED problem is defined in detail in Chapter II.

CINCLANTFLT has operational commitments in the home fleet (Second Fleet) and abroad. These commitments result from event requests that have been approved for inclusion in the fleet schedule and are referred to in this study as *primary events*. Primary events include all extended operations and major exercises. These events are the most important and the most demanding events in the fleet schedule. Other events are classified as either *major maintenance events* or *secondary events* and may be viewed as events necessary to support the successful conduct of primary events.

This study focuses on scheduling ships to the CINCLANTFLT primary events. It is assumed that (1) all primary events are fixed in start time and duration, and (2) all primary events are uniformly more important than supporting events. Assumption 1 effectively separates the process of the timing of primary events from the problem of scheduling (assigning) ships to these events. This is a good approximation of current Naval practice since most

commitments are made years in advance without detailed knowledge of future fleet assets, and also because of long-term fixed commitments. Assumption 2 allows assignment of ships to primary events without requiring concomitant scheduling of secondary events, although time must be set aside in a ship's primary event schedule to allow for subsequent scheduling of secondary events. Thus, with the above assumptions the problems of determining which events to schedule and when to schedule them are presumed solved. The remaining problem is to determine which fleet assets should be used to satisfy the primary event requirements while distributing the workload equitably among the ships.

Fleet assets may be divided into the following functional categories: naval combatant units, amphibious units, marine units, support units, submarine units, and aviation units. Within a functional category, unit operational capabilities are similar and units are employed in similar missions. Hence, substitutions within a functional category may be allowed but substitutions across category bounds are not allowed. Primary events may require assets from one or more of these functional categories; however, since substitutions are confined to functional categories, an individual asset requirement for a primary event is dependent on only one functional category. Consequently, the CPSKED model can be developed to generate annual planning schedules for assigning assets from one functional category, naval combatants in this study, to primary events without regard to other functional categories. Primary event scheduling problems considering other functional categories, e.g., amphibious units, aviation units, submarines, or support ships, can be formulated in a manner analogous to the methods presented in this study.

An instance of the CPSKED problem consists of 19 primary events and 111 ships based on 1983 historical data. The primary events may require assets by ship-type and/or weapon system capability. The 19 primary events translate to 73 event/ship-type requirements and 44 force weapon system capability constraints. The goal is to select the best annual planning schedule from all possible candidate schedules.

C. THE NEED FOR COMPUTER ASSISTANCE

Scheduling decisions directly affect fleet readiness and fleet operational performance.

> The optimized peacetime employment schedule which has as its objective maximizing combat readiness should always be the goal and guide. [Ref. 1]

Unfortunately, readiness is a vague measure which cannot be directly optimized. However, computers can be used effectively as management tools to assure that the employment schedule provides the best opportunity to maintain readiness at the highest level possible.

The opportunity to maintain readiness can be measured in terms of efficient utilization of fleet assets. The unnecessary over-employment of fleet assets adversely affects personnel morale and reduces the opportunities for maintenance and training. While over-employment is considered more detrimental to fleet readiness, under-employment results in deficiencies in operational experience with a consequent reduction in overall readiness. Thus, the effect of either over-employment or under-employment of fleet assets is a reduction in fleet readiness. In addition, assignment of a suboptimal mix of forces and capabilities to perform an operational mission or major exercise will result in degraded performance and,

in the extreme, may result in failure to achieve the objectives of the mission or exercise.

Navy employment schedules have been successfully produced for years without the assistance of computers or computer models. Furthermore, because of the unpredictable nature of ships and navy operations, it is unlikely that computer models will ever be sufficiently sophisticated to replace fleet schedulers. Computer models can, however, become valuable tools to assist fleet schedulers. Computer models may be used to speed up the process of generating a schedule and conduct "what-if" analysis on a schedule proposal. Additionally, an optimization model can provide a method of measuring the relative merit of different schedule proposals.

Currently, there exist no concrete methods for judging the acceptability of a proposed schedule. Experienced schedulers have an intuitive feeling, based on Navy policy and guidelines, about the merit of a proposed schedule. The mathematical modeling process requires that the scheduler's intuition be replaced by concrete rules and measurable criteria, yielding an analytic framework for comparing proposed schedules. Thus, the modeling process provides additional insight into the scheduling problem and results in a standardized method for evaluating a proposed schedule. The ability to critically evaluate and compare alternative proposals is potentially the greatest management tool to be gained from automating the scheduling process through the use of an optimization model.

D. CPSKED SOLUTION STRATEGY

CPSKED is an optimization scheduling tool developed and implemented as a set covering model. "Optimization" increases the model's power as a decision

support system and "set covering" provides model flexibility and precision. Large-scale set covering models, despite their advantages, are generally considered difficult or impossible to solve. This section provides the rationale, based on modeling concepts and experience gained from prior research, for selecting this approach to solve the primary event scheduling problem.

Because of their combinatorial nature, scheduling problems are difficult to solve optimally. Consequently, many suboptimal, heuristic techniques have been developed for attacking scheduling problems. However, optimization should be preferred over suboptimal techniques because optimal solutions provide a proper reference for judging the acceptability of all alternative schedules. Geoffrion and Powers [Ref. 2] have stated the need for optimization:

> The problem is not that optimization capability is needed to cope with the staggering number of alternatives...although this is important. It is not that optimization capability is needed to resolve the cost trade-offs inherent in planning, although this too is important. It is not even that managers would rather have the best answers possible from their planning support systems, although certainly this is compelling. Rather, the crux of the matter is that optimization capability is needed to permit reliable comparisons between different runs of the model.

Therefore, the goal of this study is to develop a model and solution techniques that reliably provide optimal solutions to the CPSKED problem.

Scheduling problems can frequently be viewed as selection models, e.g., route selection, crew selection, etc. In the CPSKED problem, a set of individual ship schedules must be selected such that demands for ship-types and weapon system capabilities required by different events are satisfied. Selection problems may be formulated as set covering or set partitioning problems. In terms of a scheduling problem, the objective of a set covering model is to select a minimum cost set of schedules such that all demands for service are at least minimally

satisfied or "covered." When the problem constraints are stated as equalities, i.e., demands must be satisfied exactly, the problem is referred to as a "set partitioning" or "equality constrained set covering" problem. The CPSKED problem is formulated here as a set covering problem with certain generalizations.

In the CPSKED problem, variables correspond to individual ship schedules and constraints correspond to primary event requirements. Event requirements are stated in terms of force composition (ship-types) and force weapon system capabilities. The basic development of the model is discussed in Chapter III.

Set covering problems represent a class of integer programming problems which is simple in concept. Unfortunately, like most integer programming problems, set covering problems are quite difficult to solve. However, recent advances in solution techniques have made possible the solution of large problems. (See Bausch [Ref. 3] for a survey of these computational advances.) Brown, Graves, and Ronen [Ref. 4] have applied the set partitioning model to a crude oil ocean tanker scheduling problem. Their large-scale problems (74 constraints and greater than 7,000 binary variables) were typically solved in less than one minute of IBM 3033 CPU time. Their success is based on the X System [Ref. 5] which is an advanced general purpose optimization system. Since this system is available at the Naval Postgraduate School, it is employed as the solver for the CPSKED set covering problem.

The set covering approach allows many of the real-world modeling constraints to be included in problem generator versus the problem solver. This allows for flexible and precise modeling. Essentially, the problem generator generates columns of the integer programming constraint matrix, each of which corresponds to a feasible schedule. As Bausch [Ref. 3] states "The art of

B. THE CPSKED PROBLEM

The overall employment scheduling problem involves scheduling primary, secondary, and major maintenance events for all operating forces in the Atlantic Fleet. Several independent subproblems may be identified in the overall employment scheduling problem. Divisions can be made in terms of fleet assets and event types. The CPSKED problem is an example of one of the possible independent subproblems.

1. Division by Fleet Assets

As mentioned earlier in this chapter, fleet assets include a wide variety of units performing very different functions. With respect to primary event scheduling, each of these functional categories is independent since a unit in one functional category cannot perform the mission of a unit in a different category. In primary event scheduling, mission capability is the primary consideration and the primary event scheduling problem can be divided into subproblems by functional category.

2. Division by Event Types

Major maintenance events are dependent on a unit's employment cycle and are scheduled based on shipyard availability and optimum maintenance cycles. Major maintenance schedules are developed prior to scheduling other events. Units scheduled for major maintenance become non-operational (CNOR) assets; thus, the effect of scheduling major maintenance is to limit the quantity of available operational assets for subsequent primary event employment scheduling.

Primary events are the "end products" of all fleet activity during peacetime and receive the highest priority when scheduling operational fleet assets. Primary event requirements cannot be satisfied by CNOR assets.

Secondary events are scheduled by individual units after primary event requirements have been satisfied. Secondary events are unit maintenance, training, and exercise events necessary to maintain unit readiness to support fleet operations.

Division of the overall scheduling problem by event types leads to a hierarchical ordering of the overall scheduling problems. First, solve the major maintenance scheduling problem and determine operational unit availability. Second, solve the primary event scheduling problem. Third, solve the secondary event scheduling problem using the remaining unscheduled time.

3. Primary Event Scheduling Problems

Primary event scheduling problems exist for each of the functional categories. For model development, the combatant functional category is used (thus, CPSKED for Combatant Primary Schedule); however, the resulting model may be adapted to any of the remaining functional categories.

The two major assumptions underlying primary event scheduling problems are: (1) the major maintenance schedule is known, and thus, operational asset availability is also known, and (2) the primary events are commitments that are fixed in start time and duration. The problem then becomes one of optimally assigning operational assets to satisfy primary event requirements.

C. MEASURES OF EFFECTIVENESS (MOEs)

Optimization implies the existence of a measurable criterion that is to be maximized or minimized. In the overall employment scheduling problem the stated objective is to "maintain the highest level of readiness." In recognition of

the fact that readiness is a difficult entity to measure, Navy policy defines the following as significant factors supporting fleet readiness: effective deployment of forces, maintenance, training, and personnel morale.

In the broad sense, effective deployment of forces means satisfying the primary event requirements. Decisions to commit forces to operations and exercises at home and abroad are made at the highest levels with careful consideration for their contribution to overall military readiness. Thus, effective deployment of forces is accomplished by prescribing the primary event requirements, in terms of force composition and capability, which are then converted to problem constraints. These constraints must be satisfied at the sacrifice of the remaining factors.

The remaining three major factors, maintenance, training, and personnel morale, are difficult to measure directly, and hence, more concrete MOEs that provide the opportunity to achieve these criteria are sought. The CINCLANTFLT scheduling policies described earlier in this chapter are guidelines or goals designed to maximize the opportunity for each unit to achieve the highest degree of readiness in maintenance, training, and personnel morale.

During the operational phase, CINCLANTFLT policy states that 20 working days per quarter should be assigned for maintenance upkeep. For the CPSKED problem, this implies that at least one third of the home fleet time should be reserved for in-port upkeep.

To maintain training readiness, CINCLANTFLT policy states that ten days per quarter should be provided for each ship to conduct individual ship training (ISE). ISE periods are considered secondary events and not scheduled in CPSKED; however, the CPSKED solution should reserve sufficient home fleet at-sea time to satisfy this requirement.

The major factors affecting personnel morale are family separation and crew liberty. To ensure family separation is not excessive and crew liberty is adequate, CINCLANTFLT policy establishes the following guidelines: no more than one third of the time between overhauls should be deployed time; deployments will be followed by a post deployment leave period; and ships in the operational phase should be scheduled for no more than 30 days at-sea per quarter.

A schedule that provides the optimal amount of home port time for training, morale, and maintenance, the optimal amount of home fleet underway exercise time for training, and an equitable deployment rotation of ships will provide the best opportunity to achieve the CINCLANTFLT goals for readiness. Based on this observation, a measurable MOE can be constructed from the CINCLANTFLT policy guidelines.

The approach is a *goal – programming* technique. Policy statements are used to derive ideal *target* times, or goals, for deployment time, home fleet at-sea time, and deployment rotation time. Home fleet time consists of the operational phase time less deployment time. Home port time is the home fleet time less the home fleet at-sea time. Assuming all constraints can be satisfied, the objective becomes: minimize the deviations from the ideal target times and the single MOE is a function of the deviations from the target times. If some of the constraints cannot be satisfied, constraint violation penalties, discussed in the next chapter, are included in the objective.

This objective captures the intent of the CINCLANTFLT policy guidelines; however, it cannot measure many of the intangible factors that must be considered when developing an employment schedule. Neither can the intangible

factors always be included as problem constraints. On the other hand, a human scheduler cannot possibly evaluate all scheduling alternatives to determine an optimum schedule. A human scheduler is required to ensure "all" criteria are satisfied; the optimization model is required to ensure the resulting schedule is the "best" schedule in terms of the established criteria.

The CPSKED problem may now be stated as follows: Generate an annual planning schedule for all carriers and surface combatants that minimizes the deviations from the fleet's ideal schedule (specified by target deployment time, home fleet at-sea time, and deployment rotation time) while satisfying, as best possible, all primary event requirements.

III. MODEL DESCRIPTION

This chapter presents the rationale for modeling the CPSKED problem as a set covering problem. The set covering model and generalizations are discussed and the CPSKED model is developed as an elastic set covering model. The objective function costs and penalties are developed in terms of the CINCLANTFLT policy described in the previous chapter.

A. MODEL SELECTION

Many types of scheduling problems may be solved as set covering or set partitioning problems. The basic formulation is straightforward; however, for practical problems, these formulations typically result in thousands of variables and are considered difficult to solve optimally. For this reason, approximate heuristic methods have been used extensively in solving these problems. Fortunately, a sophisticated large-scale mixed integer linear programming solver, the X System [Ref. 9], permits the efficient solution of many large-scale problems. Bausch [Ref. 3] employed the X System on test problems consisting of several hundred constraints and thousands of variables in his survey of computational techniques for solving large-scale set covering problems; the results were quite favorable. The crude oil tanker problem, Brown, Graves, and Ronen [Ref. 4], in which columns represent possible ship routes and the object is to select the least cost set of routes, contained thousands of variables and was solved using the X System in less than one minute of IBM 3033 CPU time.

Official Navy policy states that "The optimized peacetime employment schedule which has as its objective maximizing combat readiness should always

be the goal and guide." [Ref. 1] Thus schedule optimization is a Navy goal. The existence of a sophisticated, proven, large-scale solver allows formulation of the CPSKED problem as a set covering problem with high expectation of achieving optimal solutions.

B. THE SET COVERING MODEL

Set covering models formulated as integer linear programs have been known and proposed for practical applications for many years. The standard formulation is:

$$\min \sum_{j=1}^{J} c_j x_j$$

$$\text{s.t.} \sum_{j=1}^{J} a_{ij} x_j \geq b_i \qquad i = 1, \ldots, I$$

$$x_j \in \{0,1\} \quad j = 1, \ldots, J$$

where

$a_{ij} \in \{0,1\}$, and $b_i > 0$ and integer.

In this formulation, a minimum cost set of columns from the constraint matrix must be chosen such that that each constraint is satisfied, i.e., "covered" at least b_i times.

In many practical applications, the columns may be partitioned into sets where only one column per set is allowed. For example, a set may consist of all possible schedules for a single ship and exactly one of the schedules in the set must be selected. If there are K such sets, $S_1, \ldots, S_K$, the model may be generalized to admit only one column per set in the final solution. This is accomplished by adding the following constraints:

$$\sum_{j=1}^{J} \delta_{kj} x_j = 1 \quad k = 1, \ldots, K$$

where

$$\delta_{kj} = \begin{cases} 1 & \text{if } j \in S_k \\ 0 & \text{otherwise.} \end{cases}$$

The standard formulation may be generalized to admit ranges on the constraints. This generalized set covering problem is:

$$\min \sum_{j=1}^{J} c_j x_j$$

$$\text{s.t.} \sum_{j=1}^{J} \delta_{kj} x_j = 1 \qquad k = 1, \ldots, K$$

$$b_i^- \leqslant \sum_{j=1}^{J} a_{ij} x_j \leqslant b_i^+ \quad i = 1, \ldots, I$$

where

$$b_i^+ \geqslant b_i^- > 0.$$

Note that equality constrained set covering problems, i.e., set partitioning problems, can be formulated this way by setting $b_i^+ = b_i^-$ for all i.

Efficient, reliable solution of set covering models is difficult. The X System is an advanced general purpose large-scale optimization system with special features for solving integer and mixed-integer models. This system employs "elastic" programming techniques [Ref. 10]. Elastic programming assumes that all constraints may be violated at a cost. This technique allows the feasible region to be "stretched," subject to penalty costs, and generally results in more rapid convergence to an optimal integer solution. In an elastic formulation, feasible solutions always exist; the objective, then, is to find a feasible solution that minimizes both the original objective and the sum of the elastic penalties.

The elastic formulation of the generalized set-covering problem is:

$$\min \sum_{j=1}^{J} c_j x_j + \sum_{k=1}^{K} (p_k^- s_k^- + p_k^+ s_k^-) + \sum_{i=1}^{I} (p_i^- s_i^- + p_i^+ s_i^+)$$

$$\text{s. t. } 1 - s_k^- \leqslant \sum_{j=1}^{J} \delta_{kj} x_j \leqslant 1 + s_k^+ \qquad k = 1, \ldots, K.$$

$$b_i^- - s_i^- \leqslant \sum_{j=1}^{J} a_{ij} x_j \leqslant b_i^+ + s_i^+ \qquad i = 1, \ldots, I.$$

$$x_j \in \{0,1\} \qquad j = 1, \ldots, J$$

$$s_k^- \geqslant 0, \; s_k^+ \geqslant 0, \text{ and integer} \qquad k = 1, \ldots, K$$

$$s_i^- \geqslant 0, \; s_i^+ \geqslant 0, \text{ and integer.} \qquad i = 1, \ldots, I$$

where

p_k^+, p_i^+ = upper constraint violation penalties

p_k^-, p_i^- = lower constraint violation penalties

b_i^+ = upper constraint limit

b_i^- = lower constraint limit.

C. CPSKED PROBLEM FORMULATION

The CPSKED problem is formulated as a generalized elastic set covering problem using the following notation:

Indicies:

$k = 1, \ldots, K$	(rows) constraints requiring that one schedule column be selected for each ship,
$i = 1, \ldots, I$	(rows) event/ship-type requirements,
$l = 1, \ldots, L$	(rows) event/ weapon system capability requirements,

$j = 1, \ldots, J$	(columns) each representing an individual ship schedule,
$p = 1, \ldots, P$	primary schedule events,
$q = 1, \ldots, Q$	ship-types,
$w = 1, \ldots, W$	weapon system types,
S_k	index set identifying all schedule columns belonging to ship k,
R_p	index set identifying all event/ship-type requirements belonging to event p,
R_q	index set identifying all event/ship-type requirements requiring ship-type q,
V_p	index set identifying all weapon system capability requirements belonging for event p
V_w	index set identifying all weapon system capability requirements requiring weapon system type w.

Data:

c_j, $j \in S_k$	cost of schedule j for ship k.
δ_{kj}, $j \in S_k$, $k = 1, \ldots, K$	1 if schedule j is for ship k; 0 otherwise,
a_{ij}, $j \in S_k$, $i \in R_p \bigcap R_q$	1 if schedule j assigns ship k to event p as ship-type q; 0 otherwise,
λ_{lj}, $j \in S_k$, $l \in V_p \bigcap V_w$	1 if ship k has weapon system w; 0 otherwise,
b_i^-, $i \in R_p \bigcap R_q$	minimum number of ships of type q required for event p,

b_i^+, $i \in R_p \bigcap R_q$	maximum number of ships of type q allowed for event p,
b_l^-, $l \in V_p \bigcap V_w$	minimum number of weapon systems of type w required for event p,
b_l^+, $l \in V_p \bigcap V_w$	maximum number of weapon systems of type w allowed for event p,
p_k^-, $k = 1, \ldots, K$	penalty for not scheduling ship k,
p_k^+, $k = 1, \ldots, K$	penalty for assigning more than one schedule to ship k,
p_i^-, $i \in R_p \bigcap R_q$	per unit penalty for assigning too few ships of type q to event p,
p_i^+, $i \in R_p \bigcap R_q$	per unit penalty for assigning too many ships of type q to event p,
p_l^-, $l \in V_p \bigcap V_w$	per unit penalty for assigning too few weapon systems of type w to event p,
p_l^+, $l \in V_p \bigcap V_w$	per unit penalty for assigning too many weapon systems of type w to event p.

Decision Variable:

x_j	1 if schedule j is selected; 0 otherwise.

Logical Variables:

s_k^+, $k = 1, \ldots, K$	greater than 1 if more than one schedule is selected for ship k; 0 otherwise,
s_k^-, $k = 1, \ldots, K$	1 if no schedule is selected for ship k; 0 otherwise,
s_i^+, $i = 1, \ldots, I$	amount by which b_i^+ is violated,

s_i^-, $i = 1, \ldots, I$ — amount by which b_i^- is violated,

s_l^+, $l = 1, \ldots, L$ — amount by which b_l^+ is violated,

s_l^-, $l = 1, \ldots, L$ — amount by which b_l^- is violated.

Formulation:

$$\min \sum_{j=1}^{J} c_j x_j + \sum_{k=1}^{K} (p_k^- s_k^- + p_k^+ s_k^+) + \sum_{i=1}^{I} (p_i^- s_i^- + p_i^+ s_i^+) + \sum_{l=1}^{L} (p_l^- s_l^- + p_l^+ s_l^+)$$

$$\text{s. t. } 1 - s_k^- \leqslant \sum_{j=1}^{J} \delta_{kj} x_j \leqslant 1 + s_k^+ \qquad k = 1, \ldots, K$$

$$b_i^- - s_i^- \leqslant \sum_{j=1}^{J} a_{ij} x_j \leqslant b_i^+ + s_i^+ \qquad i = 1, \ldots, I$$

$$b_l^- - s_l^- \leqslant \sum_{j=1}^{J} \lambda_{lj} x_j \leqslant b_l^+ + s_l^+ \qquad l = 1, \ldots, L$$

$$x_j \in \{0,1\} \qquad j = 1, \ldots, J$$

In words, the model is interpreted as: "Choose the minimum cost set of ship schedules such that one schedule per ship is included in the set and most (ideally all) event requirements are satisfied." To produce meaningful planning schedules, the costs and penalty structures are critical to the model. These topics are the subject of the next two sections.

D. SCHEDULE COSTS

This section details the computation of the costs for individual ship schedules, i.e., the c_j values of the CPSKED model. The objective for the CPSKED model is to satisfy the event requirements while providing an equitable rotation of the ships between deployed and home fleet status and providing an

even distribution of the home fleet workload. This objective is decomposed into the following three components based on CINCLANTFLT policy goals:

1. Achieve an ideal time between successive deployments for an individual ship.
2. Maintain an ideal ratio of a ship's deployment time to between overhaul time.
3. Maintain an ideal ratio of a ship's home fleet sea time to home fleet total time.

The first two objectives replace the "equitable rotation" requirement while the third replaces the "even workload" requirement.

Under the model assumptions, an employment schedule that satisfies the event requirements while achieving the ideal times and ratios specified is considered an ideal schedule. Given the ship assets and event requirements for the Atlantic fleet, the likelihood of achieving an ideal schedule is extremely small. To obtain a schedule as close as possible to the ideal, a cost structure measuring the deviations from the ideal schedule is imposed on the problem. The following targets are established for all ships:

T_1 time (in days) between deployments,

τ_2 target ratio of deployed days to between overhaul days,

T_2 deployment time (in days) required to achieve ratio τ_2,

τ_3 target ratio of home fleet sea days to total home fleet days,

T_3 home fleet sea time (in days) required to achieve ratio τ_3

Costs C_{1j}, C_{2j}, and C_{3j} with respect to a particular schedule j are then defined in terms of the targets as follows:

$$C_{1j} = \begin{cases} 0.1 \times (\text{ deviation above } T_1) \\ 1.0 \times (\text{ deviation below } T_1), \end{cases}$$

$$C_{2j} = \begin{cases} 1.0 \times (\text{ deviation above } T_2) \\ 0.1 \times (\text{ deviation below } T_2), \end{cases}$$

$$C_{3j} = \begin{cases} 1.0 \times (\text{ deviation above } T_3) \\ 0.25 \times (\text{ deviation below } T_3). \end{cases}$$

The costs here are functions of deviation in days from the target. In terms of CINCLANTFLT policy, it is more costly to over-employ a unit rather than under-employ a unit. Consequently, costs are relatively reduced when they reflect under-employment of a unit, i.e., more time between deployments, less deployed time, or less home fleet sea time.

The *linear cost* of a schedule j is defined to be the sum of the three cost functions :

$$C_j = C_{1j} + C_{2j} + C_{3j}.$$

This column cost is intuitively appealing since it can be viewed as a measure of the total deviation in days from an ideal schedule for a particular ship. The sum of the linear costs over all ships indicates a measure of the deviation in days for the fleet employment schedule from an ideal schedule.

Frequently there will be insufficient assets of a given ship-type to satisfy the event requirements. When this occurs, ships of a different type are generally substituted to satisfy the shortfall. The acceptability of ship substitutions depends on the mission requirements for the given event. In this model, substitutions are allowed at an increased cost. Acceptable substitutions are part of the event input data, e.g., for a given event it may be acceptable to substitute an FFG for a DDG with an acceptability factor of 0.8. The acceptability factor is a measure of how well the substituting ship can perform the duties of the

required ship for the particular event and lies in the range (0,1]. The acceptability factor is used to adjust the linear cost of a schedule column containing substitution assignments. If there are no substitutions, the acceptability factor is considered to be 1.0 and the linear cost for the column is as described above. If there are substitutions, then the linear column cost is divided by the average of the acceptability factors for the events contained in the schedule column. Then, for two similar columns, one with substitutions and one without, the costs of the column with substitutions will be greater with the amount of the difference a function of the acceptability of the substitution. This procedure allows the model to discriminate between substitutions and primary assets and keeps substitutions to a minimum level.

Though appealing, the linear cost, adjusted for substitutions, may result in poor decisions if used directly in the model. The problem is illustrated by the following example:

> Suppose ships A and B have schedules with costs of 50 and 50 respectively. If ship A and B also have schedule columns with costs 0 and 100 respectively which satisfy the same combined set of event requirements, then the model will not differentiate a preference between the first cover (cost 100) or the second cover (cost 100). Part of the scheduling objective is to distribute the workload equitably over all fleet assets, hence, when costs are equal, the model should be capable of selecting the cover that distributes the costs over the most ships.

To avoid this problem, the squares of the adjusted linear costs are used in the model. This cost allows the model to resolve ties by spreading the cost over the greater number of ships.

All components of a ship's column cost are computed with regard to the ship's current employment cycle. This requires a knowledge of the following historical information for each ship:

D_1 total days in the current operational phase,
D_2 total deployed days in the current operational phase,
D_3 total home fleet sea days in the current operational phase,
D_4 last deployment completion date.

The cutoff date for this information is the last day prior to the model planning period. If a ship has not deployed since beginning its operational phase, its last deployment completion date is set to the date the ship last completed overhaul or was commissioned.

Column cost computation is described in the following equations:

Terms:

c_j model column cost,
C_j linear column cost,
C_{1j} time between deployment cost,
C_{2j} deployment cost,
C_{3j} home fleet sea cost,
α_{ij} substitution acceptability factor,
$\overline{\alpha}_j$ column average acceptability factor,
t_1 time between deployments,
t_{2i} deploy time for event i,
t_{3i} home fleet sea time for event i,
T_1 time between deployment target,
T_2 deploy time target,
T_3 home fleet sea time target,
τ_2 deploy time target ratio,
τ_3 home fleet sea time target ratio,
D_1 starting total days in operational phase,
D_2 starting total deployed days,
D_3 starting total home fleet sea days,
D_4 last deployment completion date,

d_1 total days in operational phase,
d_2 total deployed days,
d_3 total home fleet sea days,
d_4 last deployment completion date,

N ship non-operational days for the planning period (generally overhaul periods),

X slack operating days for ship-type training and individual ship exercises.

Counters:

$$d_1 = D_1 + 365 - N$$

$$d_2 = D_2 + t_{2i}$$

$$d_3 = D_3 + t_{3i} \ .$$

Targets:

$T_1 = 360$ (may be varied for each ship-type)

$$T_2 = \tau_2 d_1$$

$$T_3 = \tau_3 (d_1 - d_2) \ .$$

Cost formulas:

$$C_{1j} = \begin{cases} 0.1(T_1 - t_1) & \text{if } T_1 \geq t_1, \\ t_1 - T_1 & \text{if } T_1 < t_1, \\ 0 & \text{if event is in progress at the beginning of the planning period.} \end{cases}$$

$$C_{2j} = \begin{cases} T_2 - d_2 & \text{if } T_2 \geq d_2, \\ 0.1(d_2 - T_2) & \text{if } T_2 < d_2. \end{cases}$$

$$C_{3j} = \begin{cases} T_3 - d_3 & \text{if } T_3 \geq d_3, \\ 0.25(d_3 - T_3) & \text{if } T_3 < d_3. \end{cases}$$

$$\bar{\alpha}_j = \sum_{i : a_{ij} \neq 0} \alpha_{ij} \ / \ \sum_i a_{ij}$$

$$C_j = (C_{1j} + C_{2j} + C_{3j}) \ / \ \bar{\alpha}_j$$

$$c_j = C_j^2$$

E. PENALTIES

In the elastic formulation of the model, penalties can be categorized as either model disruption penalties or goal violation penalties. When violation of an inelastic constraint has no physical interpretation, the penalty for violating the constraint is a model disruption penalty; these penalties should be sufficiently small to allow reasonable relaxation of the feasible region, yet great enough to enforce the constraint in the final solution. When a constraint can be violated at a cost in the final solution, the constraint is actually a goal and the penalty is a goal violation penalty.

In the CPSKED problem, the first set of constraints require that exactly one schedule column be selected for each ship. The second set of constraints requires that the correct force composition be assigned for each event. The third set of constraints requires that correct set of weapon system capabilities is assigned for each event. The associated ranges and penalties for these sets of constraints are assessed separately.

1. Ship-Schedule Constraints

Since exactly one schedule is desired for each ship, the upper and lower ranges on the ship-schedule constraints are both set to one. Violation of the upper range implies that a ship would receive more than one schedule for the planning period. A ship cannot be employed in different locations simultaneously; hence, the upper range must not be violated in the final solution. The penalty then is a model disruption penalty that increases problem elasticity while enforcing the upper range on the constraint. A ship schedule cost is measured in terms of days deviation from an ideal ship schedule. Schedule costs beyond a certain limit, typically 200-300 days deviation, would be

counterproductive to maintaining a high state of combat readiness. An upper bound on this limit of 1000 days deviation is used to establish the model disruption penalty. The CPSKED objective function is in terms of days deviation squared, thus the penalties must also be in days deviation squared and the resulting penalty is 1.0×10^6 days deviation squared. Any combination of columns for a particular ship will cost more, including penalty, than any single column for the ship and consequently, multiple schedules will not be selected in any optimal solution.

Violation of the lower range on a ship-schedule constraint corresponds to not scheduling that ship. The lower penalty, then, should be the price at which it is acceptable to allow the ship to remain idle throughout the planning period. In the CPSKED model, the "idle" price is computed for each ship, this price is equivalent to the column cost for a "do nothing" column. The "idle" price squared is then used as the penalty for violating the lower range of the ship-schedule constraints.

2. Event Requirement Constraints

In the CPSKED model, the events are CINCLANTFLT commitments and the event requirement constraints can be interpreted as goals to meet those commitments. It may not be possible to meet these goals at any reasonable cost. The penalties associated with these constraints are goal violation penalties.

The lower range b_i^- on an event requirement constraint corresponds to the minimum number of ships of a particular type required for the event. Event values are assumed to be related to the event duration and deployment status. Generally, short home fleet sea events are more easily canceled or rescheduled than long duration deployed events and consequently receive a lesser value in the

schedule planning process. In the CPSKED model the event values are defined to be the duration of the home fleet sea days and/or the deployed days contained in the event. The lower penalty p_i^- is a price above which the cost of committing additional assets to the event exceeds the value of the contribution of those assets. In this model, the lower penalty is a function of the event value and may be adjusted within the program.

Situations arise where a ship would be under-employed if all minimum event requirements b_i^- are met exactly. Under these circumstances, it may be desirable to schedule the ship for some events in excess of minimum event requirements in order to maintain training and proficiency for the ship. To allow for this possibility, the upper range b_i^+ for all event requirements may be set above the minimum requirement. In most instances, ship assets will be in short supply and the lower range will be binding. The upper penalty p_i^+, in effect when the upper range is exceeded, is a function of the event value and may be adjusted within the program.

3. Force Weapon System Capability Constraints

Frequently, primary events may require a specified set of force weapon system capabilities. Weapon system capabilities are not necessarily unique to ship types and hence, the force system capability requirements may be satisfied by various mixes of ships. Penalties for violating these constraints are related to the additional value a particular weapon system contributes to an event's mission and consequently should be input data under the scheduler's control. These penalties should be high enough to enforce the constraints but less than event/ship-type penalties since a weapon system contributes less than an entire unit to the event's mission. In this prototypic implementation, these penalties

were all set to 1,000 (lower) and 0 (upper). These penalties worked well in the model; however, a more thorough knowledge of mission requirements and system contributions would enable improvements.

IV. PROBLEM GENERATION

Solving the CPSKED problem consists of four steps; problem formulation, problem generation, problem solving, and report writing. In this chapter, the second step, problem generation is discussed. In the set covering formulation each of the variables represents a candidate schedule. A primary advantage of this formulation is that only those schedules that are viable need be included in the problem, e.g., time restrictions, cost limits and other real-world constraints may be used in the problem generator to reduce the size of the problem sent to the solver. In a complete set covering problem with m inequality constraints, there are $2^m - 1$ variables or columns. Complete set covering problems rapidly become very large and consequently become difficult or impossible to solve even with the best of solvers. In practical applications, many columns in the complete set will have no usable real-world interpretation with respect to the application. Other columns may violate restrictions on time, speed, distance, costs, etc. To reduce the size of the problem that is ultimately sent to the solver, the column generator should incorporate as much of the column feasibility criteria and real-world restrictions as possible. In the following sections, the techniques used to generate the CPSKED columns are discussed. Since there is a one-to-one correspondence between ship schedules and model columns, the terms "schedule" and "column" are used interchangeably.

A. GENERATING FEASIBLE SCHEDULES

The following three rules are used to determine whether or not a schedule for a particular ship is feasible:

Rule 1. A unit must be of the proper type, or an allowable substitute, to satisfy an event requirement constraint.

Rule 2. A unit may not participate in primary events when the unit is in a non-operational status.

Rule 3. A unit cannot be participate in more than one primary event at any given time.

These rules are used to generate all feasible ship schedule as follows:

For each ship k perform the following steps:

Step 1. Determine the ship-type q and, using rule 1, select all event requirement constraints that demand type q units or allow type q units as substitutions. This "potential ship-event list" is the list of events that ship k could potentially participate in.

Step 2. Determine the ship non-operational periods from input data and, using rule 2, compute the time intersection of each event in the "potential ship-event list" with the non-operational periods. If the time intersection is not null, delete the event from the "potential ship-event list." The resulting list is the "ship-event list."

Step 3. Construct a schedule network as follows: Define a starting node, s, and connect this node to all events in the ship-event list. Using rule 3, connect additional arcs between event pairs if the time intersection of the events in the pair is null; the direction of the arc is from the earlier event to the later event.

Step 4. Let v correspond to an event in a schedule, the set of all directed $s-v$ paths for all v in the network corresponds to the set of all feasible schedules for the ship. Enumerate each $s-v$ path j and set column coefficients: (a) $a_{ij}=1$ if i is on the $s-v$ path; (b) $\delta_{kj}=1$; (c) $\lambda_{lj}=1$ if ship k satisfies part of event/weapon system capability requirement l; and (d) 0 otherwise.

In the CPSKED column generation program, event requirement inputs may be specified by either ship-type or ship hull number. When a scheduler knows *a priori* that a ship must participate in a certain event, the requirement should be input by hull number. The column generator then forces all columns for that hull number to contain the event. Additionally, if a type requirement demands

n units and all n units are specified by hull number, then only those units will contain the event in their ship-event network, i.e., only those units will be considered for satisfying the event/ship-type requirement. Thus column reductions will occur if all units for a specific type requirement are specified by hull number. This is equivalent to fixing assignments in the schedule. Events in progress at the beginning of the planning period should be fixed in this manner. Also, any requirements that must be satisfied by a particular unit should be fixed to ensure the desired results and to reduce the size of the problem.

The CPSKED column generator allows ship-type substitutions to be specified, at a cost, for each type requirement. If there are n of the required ship-type and m of the substitution ship-type, then there will be $n+m$ candidates available to satisfy the requirement, and a consequential increase in the number of columns. Allowable substitutions should be used sparingly and only where tactically feasible, e.g., a carrier would never substitute for a frigate and a frigate would probably never substitute for a cruiser. Substitution strategy may have a dramatic effect on the number of feasible columns generated.

B. COLUMN REDUCTION

The number of columns produced by the method described above is much less than the $2^I - 1$ combinations which would be produced by a naive generator. Nevertheless, the number of columns can grow very large. Many of these columns may correspond to unit schedules that are unacceptable because of excessive cost. Excessive cost corresponds to severe over-employment of the unit and is counterproductive to the maintenance of high fleet readiness.

After each schedule column is generated, a cost for that column is computed. The cost represents a measure of the deviation from the ideal

individual ship schedule. For each of the component costs, limits may be established beyond which the schedule is deemed completely unacceptable. If the cost of a column exceeds these limits, it is not included in the problem. The CPSKED column generation program accepts the following limiting parameters by ship-type:

Maximum home fleet sea cost,
Maximum deployment cost,
Maximum time between deployment cost,
Maximum column cost.

If an event requires a specific ship by hull number, then that event becomes mandatory for the ship; the cost limits are ignored for the column that contains only mandatory events. Significant reductions in the number of columns sent to the solver are possible using this cost limiting approach.

V. IMPLEMENTATION AND RESULTS

The CPSKED model has been implemented at the Naval Postgraduate School. Input data for testing this implementation has been extracted from the Atlantic Fleet projected annual schedule for calendar year 1983. The testing results indicate that high quality schedules are produced efficiently. Schedule quality is based on comparisons of the CPSKED schedule and the CINCLANTFLT schedule. Model efficiency is discussed in terms of computational experience based on four model runs.

A. COMPUTER PROGRAMS

The CPSKED model has been implemented on an IBM 3033 AP computer system under the CMS operating system. CPSKED consists of three parts; the column generator, the solver, and the report writer.

1. Problem Generator

The CPSKED problem generator is written in ANSI standard FORTRAN 77 and compiled by IBM VS FORTRAN. The program uses a Ship Data file and an Event Data file for input. The program produces an unformatted file which is read directly by the solution driver; this file represents the CPSKED problem in a compact data format suggested by Bausch [Ref. 3].

2. Problem Solver

The solver consists of a problem driver, XSCOVC, and several subroutines. The X System solver routines are written in Level 66 FORTRAN and compiled by the IBM FORTRAN IV H (Extended) compiler. The solver employs many advanced features including hypersparse data representation,

complete constructive degeneracy resolution, basis factorization, and elastic range constraints. The X System may be tailored to specific models to form the computational foundation for specialized application packages. In this development, the CPSKED programs have not been integrated with the solver to take full advantage of the solver's capabilities. In the CPSKED implementation, the solver generates a compact data file representing the CPSKED solution; this file is used as an input file to the CPSKED report writer. The driver, XSCOVC, also produces a condensed output report containing solution characteristics and computational statistics for the problem solution.

3. Report Writer

The CPSKED report writer is written in ANSI standard FORTRAN 77. The program uses the Ship Data file, Event Data file, and schedule solution file as inputs and produces the following reports:

Ship Statistic Report;
Ship Schedules Report;
Event Force Assignment Report.

Samples of the input data files and the CPSKED reports are included in the Appendices.

B. TEST DATA

The model has been tested using actual data from the Atlantic Fleet for calendar year 1983. Model input consists of a ship data input file and an event data input file. Sample input data files are included as Appendices A and B. Scheduling parameters, or goals, are set within the column generation program.

1. Ship Data

The Atlantic Fleet carrier and surface combatant assets for the calendar year 1983 consisted of the ships listed in Table 1.

TABLE 1

1983 Atlantic Fleet Combatants

	Type	Number
Aircraft Carriers	CV/CVN	9
Guided Missile Cruisers	CG/CGN	14
Guided Missile Destroyers	DDG	23
Destroyers	DD	17
Guided Missile Frigates	FFG	19
Frigates	FF	29
Total		111

Non-operational periods, overhaul etc., and historical data for these assets are known and included in the ship input data file. The requirement to select exactly one schedule for each ships results in 111 schedule selection constraints.

2. Event Data

All extended operations and major exercises involving surface combatant units were extracted from the CINCLANTFLT annual schedule resulting in the event list displayed in Table 2.

A primary event is composed of a collection of sub-events; each of these sub events corresponds to an employment term (EMPTERM) used in the Atlantic Fleet Schedule. Each sub-event is designated as deployed time, home fleet sea time, or home fleet inport time. The primary event, MED 2-83, is used as an example, see Table 3.

TABLE 2.

1983 Primary Event List

Extended Operations	Major Exercises
MED 1-83	COMPTUEX 2-83
IO 1-83	SOLID SHIELD 83
MEF 1-83	OCEAN SAFARI 83
MEF 2-83	COMPTUEX 3-83
SNFL 1-83	COMPTUEX 4-83
IO 2-83	COMPTUEX 1-84
MED 2-83	
MEF 3-83	
SNFL 2-83	
UNITAS	
MEF 4-83	
MED 1-84	

(listed in order of event start time)

TABLE 3.

MED 2-83 Sub-events

	EMPTERM	START	END	CODE
Primary event:	MED 2-83	069	355	
Sub-events:	EXER (Readex 1-83)	069	092	S
	POM	093	122	I
	ENR (Transit)	123	133	D
	OPCON	134	315	D
	ENR (Transit)	316	325	D
	LVUPK (Stand down)	326	355	I

codes: D - Deployed time,
I - Home fleet in port time,
S - Home fleet sea time.

A primary event requires a specific force composition, with possible allowance for substitution of assets. These requirements result in the event/ship-type constraints. Typical requirements, based on the MED 2-83 example, are listed in Table 4.

TABLE 4.

MED 2-83 Ship-Type Requirements

Type	Hull	Substitution	Number
CV/CVN	69	none	1
CG/CGN	any	DDG, α = 0.7	2
DDG	any	DD, α = 0.8	2
DD	any	none	2
FFG	any	FF, α = 0.7	3
FF	any	none	3

Force weapon system capability requirements are based on current requirements for forces deploying to the Mediterranean, Middle East, and Indian Ocean. Typical requirements using the MED 2-83 example are listed in Table 5.

TABLE 5.

MED 2-83 Capability Requirements

System	Number
AAW Missile (SM-1/ER)	2
AAW Missile (SM-1/MR)	4
AAW Radar (SPS-48)	3
Data Link (NTDS)	4
Passive Sonar (TASS/TACTAS)	3
ASW Helicopter (LAMPS)	3
Guns (5in/54)	4

The 1983 primary events result in a total of 73 event/ship-type constraints. Force weapon system capability requirements result in 44 additional constraints.

3. Scheduling Parameters

The parameters listed in Table 6 represent the scheduling policy goals and cost limits used in the model runs. These parameters may be modified in the problem generator.

TABLE 6.

Scheduling Parameters

	CV/CVN	CG/CGN	DDG	DD	FFG	FF
T_1	360	360	360	360	360	360
τ_2	.33	.33	.33	.33	.33	.33
τ_3	.33	.33	.33	.33	.33	.33
Max C_1	120	120	120	120	120	120
Max C_2	180	180	120	120	90	90
Max C_3	90	90	60	60	45	45
Max C_j	300	180	150	150	120	120

C. SCHEDULE QUALITY

CPSKED captures the essence of CINCLANTFLT scheduling policy and provides an optimum schedule with respect to that policy. The objective costs, including penalty costs, indicate the overall quality of a schedule, e.g. a schedule with a total objective value of zero is one that satisfies all requirements and exactly achieves all of the CINCLANTFLT policy goals.

The CINCLANTFLT annual schedule did not contain projected ship assignments for all projected primary events, e.g., UNITAS and several exercises were scheduled with ship assignments indicated "DTMD" for "to be determined." To place the CINCLANTFLT schedule on an equal basis with CPSKED for conducting comparisons, all known CINCLANTFLT ship assignments were fixed and CPSKED was run to optimize the remaining part of the schedule. The

result is CINCLANTFLT's annual schedule with all "DTMDs" optimally assigned. Table 7 lists the schedule summary data used to compare this CINCLANTFLT schedule to the CPSKED schedule.

TABLE 7.

CINCLANTFLT vs. CPSKED

	CINCLANTFLT	CPSKED	% IMPROVEMENT
-Objectives-			
Cost:	1,472,500	446,700	70%
-Penalties-			
-violations-			
Sched selection:	0	0	0%
Event/Ship-type:	0	0	0%
Weapon Capabilities:	11	9	18%
-Unit Costs-			
-mean (std.dev.)-			
Total (C_j):	48.2(57.3)	42.7(49.0)	11%(14%)
TBD (C_{1j}):	44.9(43.9)	34.7(28.9)	23%(34%)
DEP (C_{2j}):	25.9(40.4)	24.5(40.1)	5%(1%)
SEA (C_{3j}):	3.9(4.4)	2.9(3.3)	26%(25%)
-Unit Statistics-			
TBD (target 360):	329(142)	344(103)	5%(27%)
DEP Ratio (target .33):	.33(.10)	.34(.09)	-3%(10%)
SEA Ratio (target .33):	.30(.06)	.30(.05)	0%(16%)

The CPSKED model reflects a 70% improvement in quality and also violates fewer weapon system capability goals. Average individual unit costs are not only reduced, they are spread more equitably over the ships as indicated by reduced standard deviations.

A model can never capture all of the criteria involved in scheduling navy ships and, consequently, the full magnitude of improvement indicated by this

comparison may not be achieved. However, a human scheduler can neither evaluate all of the scheduling combinations considered by the model, nor can he hope to compute measures of effectiveness with any precision. Significant scheduling improvements can be achieved by teaming the human scheduler and the model together.

After making an initial reference run of the model, the human scheduler may add constraints or "what-if" questions to the model by fixing specific event/ship assignments. The model should be run again producing an optimal schedule subject to the newly imposed restrictions. The scheduler must then determine whether the restrictions are justifiable in terms of the increased costs. Thus, inter-run comparisons provide a means for developing optimal schedules and for conducting "what-if" analysis. Geoffrion and Powers remarks on inter-run comparisons with distribution planning models apply here as well.

> It is our repeated observation that the motives for making inter-run comparisons are so overwhelming that, in practice, comparisons ... are made and conclusions drawn even when a heuristic (suboptimal) rather than optimizing procedure is used....The importance of inter-run comparisons should not be underestimated. They are needed to justify conclusions reached with the help of the model by (a) exploring uncertain assumptions, (b) studying the impact of alternative futures, and (c) measuring the performance differences between the leading alternatives. ...If the solver is heuristic in character, such comparisons will be very unreliable because comparing two error-prone solutions greatly magnifies the relative error. [Ref. 2]

The best human schedulers will always produce suboptimal schedules. The quality gap between the CINCLANTFLT and CPSKED schedules indicates considerable room for improvement. Narrowing the gap demands optimization support, such as CPSKED, and results in more efficient utilization of fleet assets.

D. COMPUTATIONAL RESULTS

Computational results are discussed in terms of problem characteristics, problem size, and model execution times. The model was run under the following conditions:

1. CPSKED(NS) without substitutions;
2. CPSKED(SU) with substitutions and unlimited costs;
3. CPSKED(S) with substitutions and cost limits;
4. CPSKED(CLF) with CINCLANTFLT fixed assignments.

Run 1, without substitutions, was made to establish a reference objective value and determine if all events could be satisfied without substitution. Run 2, with selected substitutions and no cost limits was made to demonstrate the reduction in problem size that may be achieved by including cost limit constraints in the problem generator. Run 3 was made to demonstrate the effect of allowing ship-type substitutions. Run 4 includes all fixed assignments from the CINCLANTFLT annual schedule. Results of the runs are summarized in Table 8.

1. Characteristics

In each run there are 111 ship-schedule selection constraints, 73 event/ship-type constraints, and 44 force weapon system capability constraints. There are 105 ships operational for some period during the planning year, the remaining 6 ships are not operational at any time during the year. Events in progress at the beginning of the year and carrier participation in extended operations are fixed assignments in all runs.

2. Problem Size

Problem size in terms of the number of columns and non-zero elements sent to the solver is a function of the number of substitutions allowed, the number of assignments fixed, the total number of constraints, and the cost limits imposed in the problem generator.

TABLE 8.

CPSKED Results

	Run 1 CPSKED(NS)	Run 2 CPSKED(SU)	Run 3 CPSKED(S)	Run 4 CPSKED(CLF)
-Characteristics-				
Total Ships:	111	111	111	111
Operational Ships:	105	105	105	105
Total Events:	19	19	19	19
Allowed Subs:	no	yes	yes	yes
Cost Limits:	yes	no	yes	yes
-Objectives-				
cost:	395,200	427,000	446,700	1,472,500
-Penalties-				
Schedule Selection:	0	0	0	0
Event/Ship-type:	4,144,000	0	0	0
Weapon Capability:	10,000	7,000	9,000	11,000
Total:	4,549,200	434,000	455,700	1,483,500
-Problem Size-				
Rows:	228	228	228	228
Columns:	4,109	15,193	10,723	3,984
Non-Zeros:	19,019	84,247	55,404	19,092
-Run Times-				
-(in cpu seconds)-				
Generator:	2.3	8.3	6.2	2.4
Solver:	23.0	172.8	113.0	22.6
Reports:	0.6	0.7	0.7	0.7

Substitutions dramatically increase the problem size as indicated by a comparison of runs 1 and 3; however, the event/ship-type penalties observed in run 1 indicate that all requirements could not be satisfied without substitutions. Commitments must be met, and consequently, substitutions are necessary to avoid event/ship-type penalties.

Fixing schedule assignments that are known *a priori* will significantly decrease the problem size; however, fixing assignments can be expected to increase the costs and may increase the number of goal violation penalties. Compare runs 3 and 4.

The number of event/ship-type constraints will influence the number of columns generated because more events are added to the event list used to generate the columns. However, the addition of weapon capability constraints only increases the number of rows in the problem.

The inclusion of cost limits in the problem generator results in a problem size reduction of approximately 30% with little degradation in the cost objective, compare runs 2 and 3.

3. Execution Times

Total execution time for model runs consists of generation time, solution time, and reporting time. To effectively employ CPSKED as a decision support system requires rapid execution. Generation and reporting time are relatively insignificant when compared to solution time. Solution time is influenced by the problem size, problem penalties, and the techniques employed by the solver. The solution times observed in this study compare very favorably with solution times for other large-scale set covering problems. [Refs. 3,4, and 11]

VI. CONCLUSIONS AND RECOMMENDATIONS

This study has demonstrated that optimization techniques can produce high quality annual fleet employment schedules efficiently. Response times are short enough to permit using this model in an interactive schedule planning system. Refinements in the implementation of this model can further reduce solution times.

The CINCLANTFLT versus CPSKED schedule comparisons indicate there is room for improving fleet employment schedules. Optimization models similar to CPSKED can become powerful management tools for developing, refining, and maintaining employment schedules.

An optimization model provides a means for considering "all" alternatives to determine the "best" schedule subject to the constraints supplied to the model. This schedule may then be used as a reference for comparing alternate schedules that may include additional criteria not evident in the initial model run. Because of the relatively fast response times, this process may be conducted iteratively until a final acceptable annual schedule is developed. The optimization model ensures that costs are minimized. The scheduler, or decision maker, must decide whether the additional criteria are justifiable in terms of the resulting increased costs. Thus, the model provides the decision maker with the capability of producing high quality optimum schedules that satisfy, or at least consider. all scheduling criteria.

In its present state of development, the CPSKED implementation is not an end-user product. It does not possess a user-friendly front end and has not been

fully integrated with the solver. Input data requirements are extensive and presently require fixed formatted files. An end-user implementation should include an interactive front end for generating event requirement input. The front-end should incorporate "canned" requirements that can be edited for recurring events. The model should also have access to a data base for extracting and updating the ship input data. Integration of the problem generator and the solver can reduce file handling and exploit more of the X System's capabilities to reduce overall execution time.

The model development in this study has focused on scheduling combatants to primary events. The model may be applied to other primary event scheduling problems, e.g., amphibious forces, service forces, etc., by changing the input data files and scheduling parameters.

Navy doctrine states that "The optimized peacetime employment schedule that has as its objective maximizing combat readiness should always be the goal and guide." CPSKED, or a similar optimizing decision support system, can, and should, be used to assist schedulers in achieving that objective.

APPENDIX A

SAMPLE EVENT INPUT DATA

Card Type	Card Columns	Data Description
All	1	Card type M = Major event card S = Sub-event card H = Hull requirement card T = Ship-type requirement card W = Weapon system requirement card N = Hull specification card
M	2-4	Event number
	5-26	Event name
	27-30	Julian start date
	31-34	Julian completion date
S	2	Event code E = Major employment C = Concurrent employment
	3	Status code S = Home fleet at-sea operations D = Deployed operations
	4-12	Employment term (EMPTERM)
	13-28	Location term
	29-43	Supplemental information
	44-63	Remarks
	64-67	Julian start date
	68-71	Julian completion date
H	2-14	Six 2 digit codes indicating the number of ships of types 1 thru 6 required by hull number. For each non-zero field an N card is required.
T	2-13	Six 2 digit codes indicating the number of ships of types 1 thru 6 required by ship-type. Does not include ships required on H card.
W	2-19	Up to nine 2 digit codes indicating the number of weapon systems of types 1 thru 9 required.
N	2-3	2 digit code indicating ship type
	4-39	Up to nine 4 digit ship hull numbers, the number of fields used must correspond with the number indicated on the H card for the corresponding ship type.

ship types	1 = CV/CVN 2 = CG/CGN 3 = DDG 4 = DD 5 = FFG 6 = FF
weapon systems	1 = AAW missile systems SM1-ER 2 = AAW missile systems SM1-MR 3 = AAW Radar system SPS-48 4 = Data link system NTDS Link-11 5 = Passive sonar system TASS/TACTAS 6 = Helo capability LAMPS 7 = 5"/54 Gun system

APPENDIX B

SAMPLE SHIP INPUT DATA

Card Column	Data Description
1-2	Ship-type code (1 thru 6)
3-6	Ship-type designation (CV/CVN, CG/CGN, DDG, DD, FFG, FF)
7-10	Ship hull number
11-33	Ship name
34-37	Overhaul or precom start date (current planning period)
38-41	Overhaul or precom completion date
42-45	Non operational start date (except overhaul)
45-48	Non operational completion period
49-52	Total days since last overhaul or commissioning thru the start of the current planning period.
53-56	Total deployed days since last overhaul thru the start of the current planning period.
57-60	Total home fleet operational days since last overhaul thru start of current planning period.
61-64	Total home fleet at-sea days since last overhaul thru start of current planning period.
65-68	Date last deployment completed or last day before planning period is ship is deployed or overhaul completion date or commissioning date.
69-78	weapon system indicators 1=installed, 0=not installed.
ship types	1 = CV/CVN 2 = CG/CGN 3 = DDG 4 = DD 5 = FFG 6 = FF
weapon systems	1 = AAW missile systems SM1-ER 2 = AAW missile systems SM1-MR 3 = AAW Radar system SPS-48 4 = Data link system NTDS Link-11 5 = Passive sonar system TASS/TACTAS 6 = Helo capability LAMPS 7 = 5"/54 Gun system

APPENDIX C

SAMPLE SHIP STATISTICS REPORT

Column Heading	Data Description
Nr.	CPSKED ship number
Hull Nr.	Ship type and hull number
Ship Name	Ship name
Sked Cost	Schedule column cost, C_j
Ship Cost	Ship schedule cost, $C_{1j}+C_{2j}+C_{3j}$ note, this does not include substitution factor.
C1	Time between deployment cost, C_{1j}
C2	Deployment cost, C_{2j}
C3	Home fleet sea cost, C_{3j}
CY Days	Days since last overhaul or commissioning
DEP Days	Deployed days since last overhaul or commissioning
PCT Dep	Percentage of days deployed since last overhaul or commissioning
HOME Days	Home fleet days since last overhaul or commissioning
SEA Days	Home fleet sea days since last overhaul or commissioning
PCT Sea	Percentage of home fleet days spent at sea since last overhaul or commissioning
TBLD	Time between last deployments
Last DEP	Last deployment completion date or last day of planning period if deployed or in overhaul or commissioning or overhaul completion date
	Summary lines include fleet averages and standard deviations. Non-zeros indicate the number of ships used to compute the fleet summary statistics.

APPENDIX D

SAMPLE EVENT REPORT

The Event Report lists all primary events that have been scheduled. The "Type Requirement" line indicates the constraint row numbers associated with the event/ship-type requirements in CPSKED and the number of units of each type required. The ships assigned by CPSKED are listed under "Forces Assigned."

APPENDIX F

SAMPLE SOLVER OUTPUT REPORT

The Solver Output Report is a partial output report from the X System. The report lists all CPSKED row constraints with their associated ranges, penalties, and final solution values. The second part of the report lists the final solution by column, column cost, and column elements. Total solution time is printed at the bottom of the report.

EVENTLG SOLUTION OUTPUT
